Problem 1

Part A

Distribution of Course Evaluation Scores

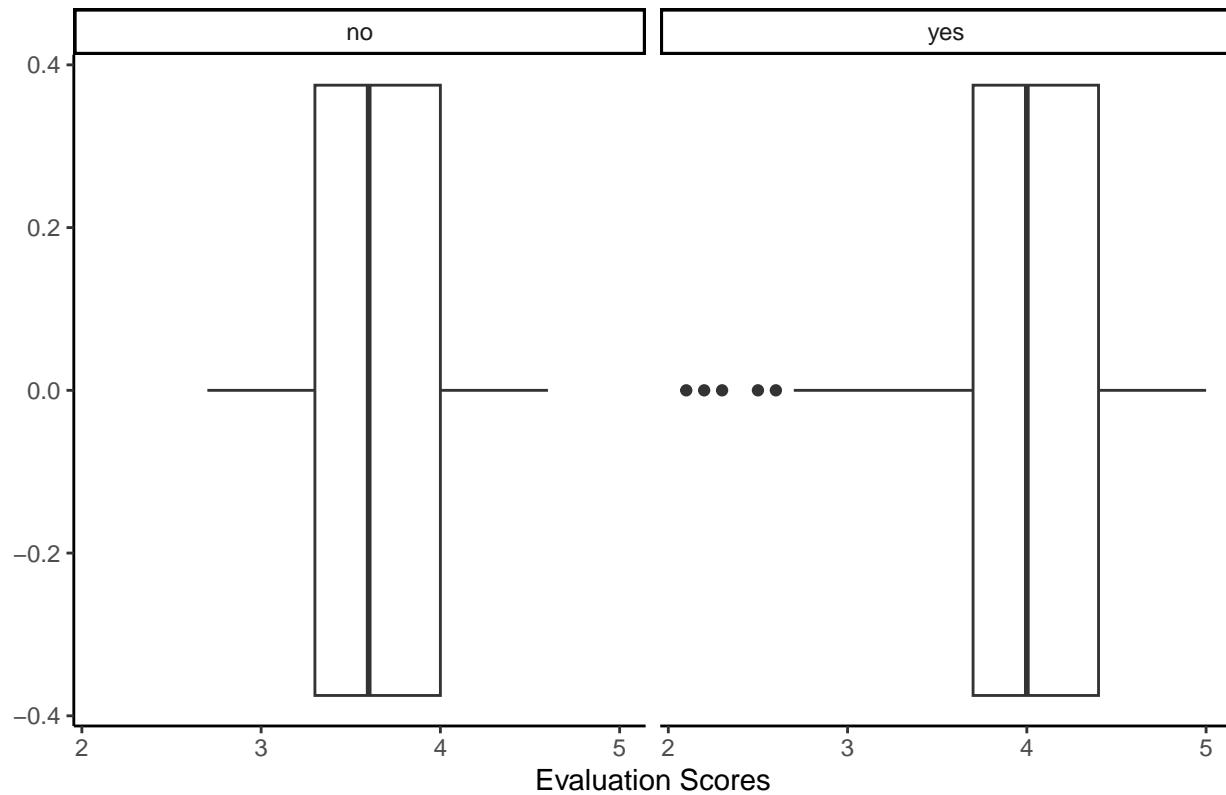

This histogram shows the distribution of course evaluation scores (Evaluation Scores)

The distribution seems to be skewed towards 4 out of 5 points, meaning that a lot of students were quite satisfied with their professors.

Part B

Course Evaluations Among Professors who are Native vs. Non-native English

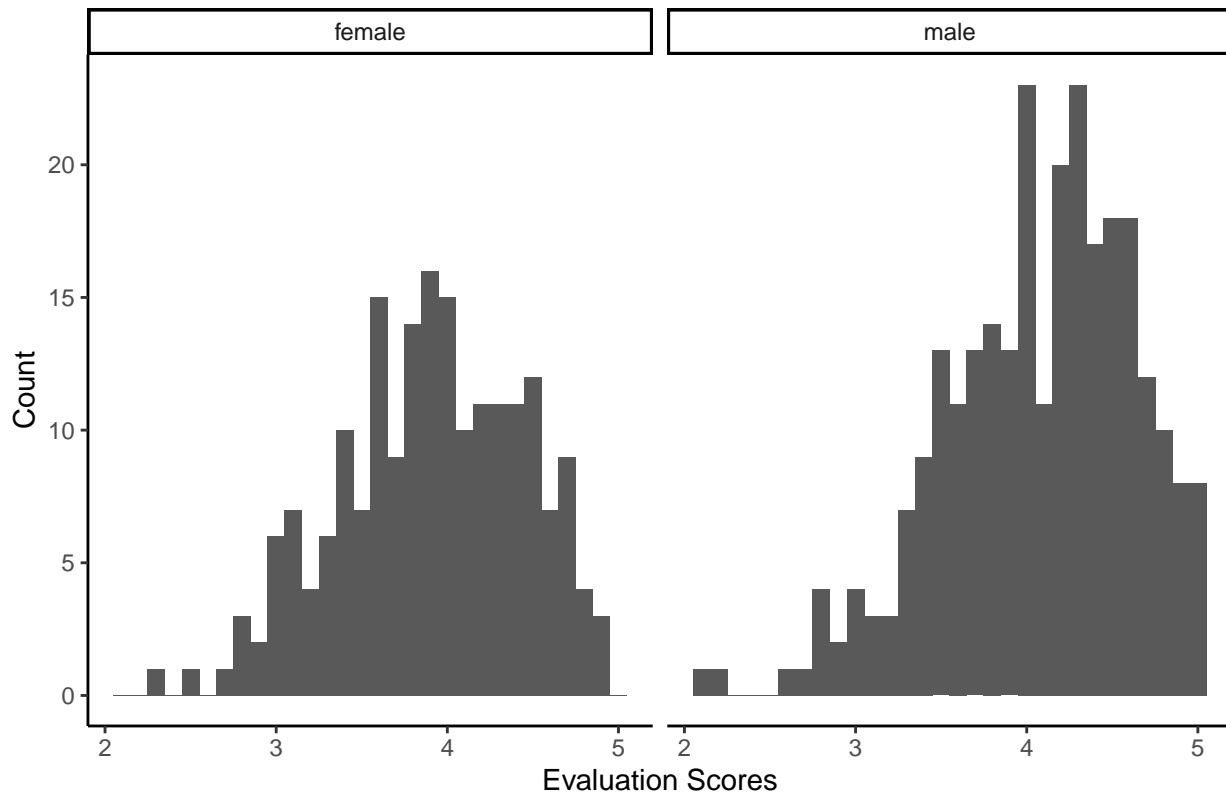

Distribution of course evaluation scores (Evaluation Scores) among professors who are native or non-native English speakers

According to the box plots, the distribution of ratings among professors who are non-native vs. native professors are similar. However, there are outliers in which students gave low ratings to some professors who are native speakers. However, this can be due to other personal reasons since the difference is not very significant. Therefore, nativeness in English is not a major determinant of course evaluations.

Part C

Distributions of Course Evaluation Scores Among Professors of Different Ge

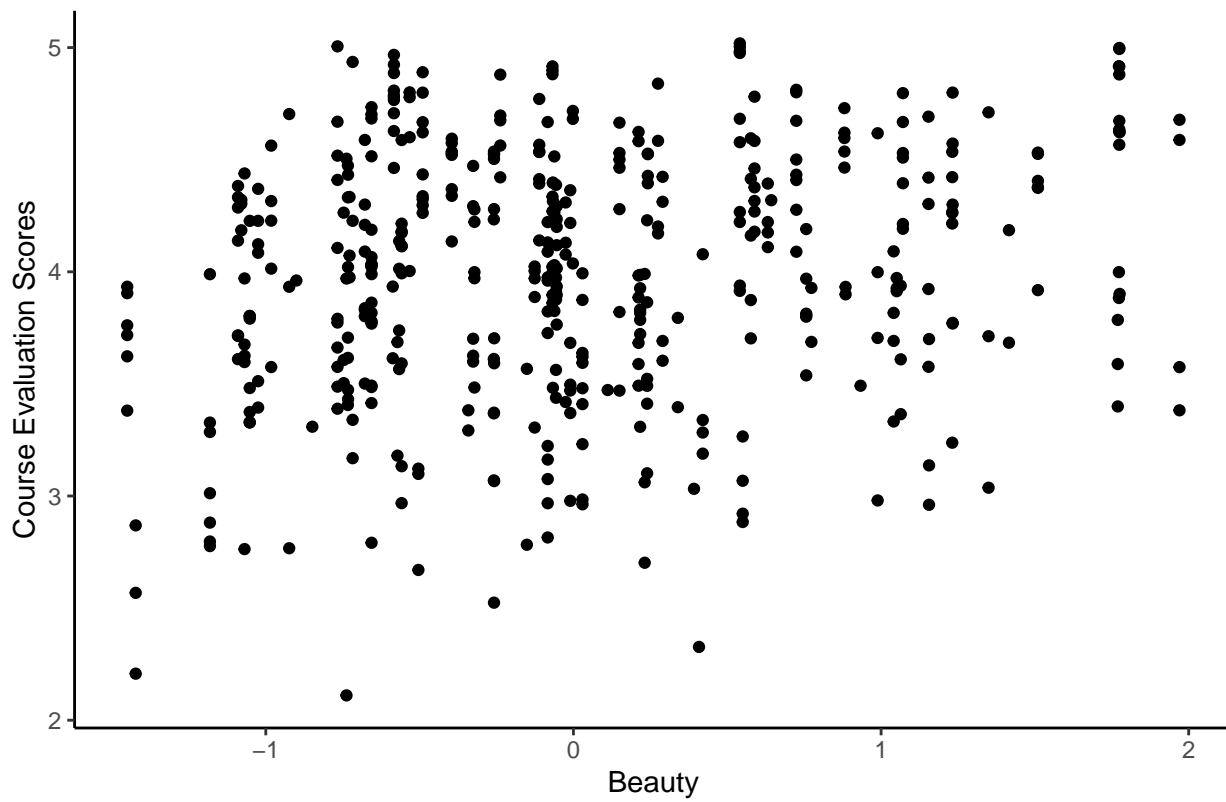

Distribution of course evaluation scores (Evaluation Scores) among female and male professors

According to the two histograms, the distribution of course evaluations among female and male professors look very similar. However, there is apparently a greater count of male professors when compared to female professors.

Part D

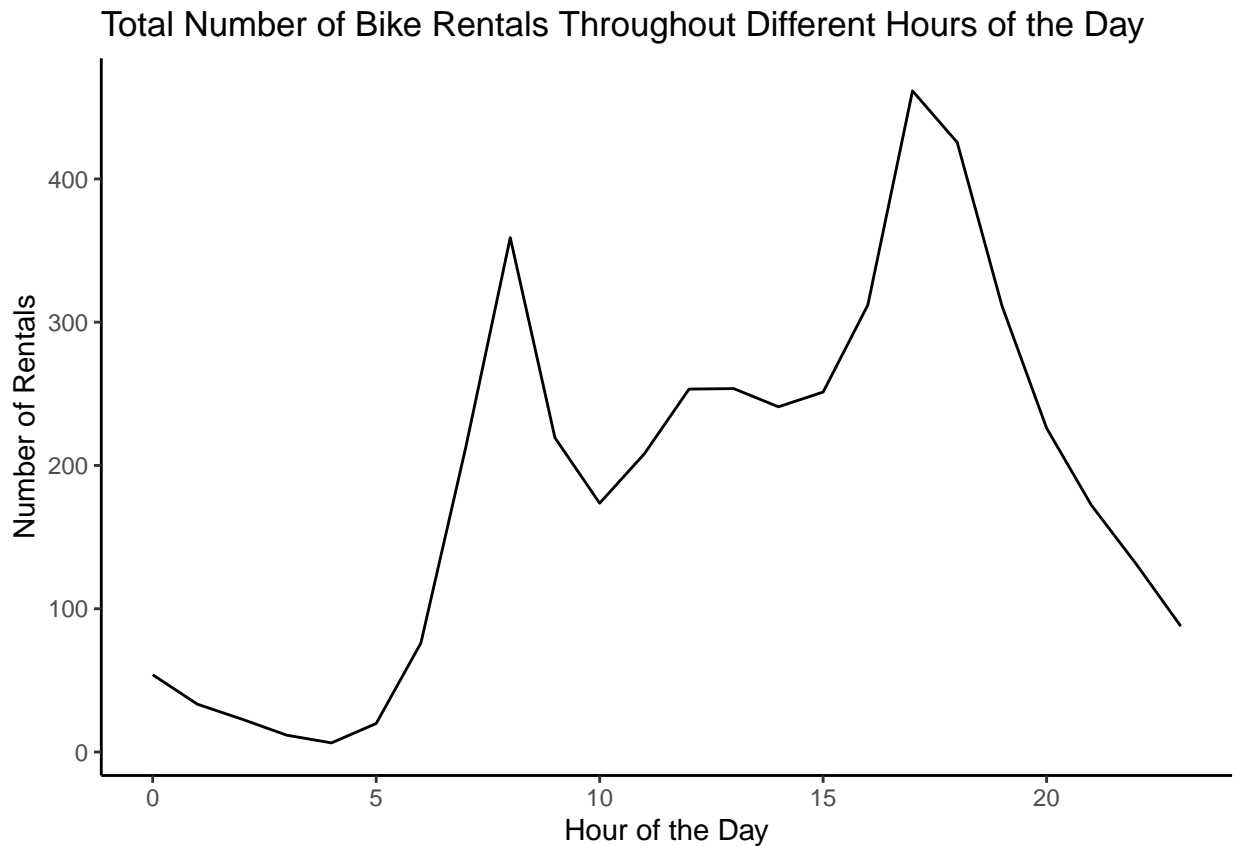

Relationship Between Beauty and Course Evaluations

Relationship between beauty (Beauty) and the evaluation score of professors (Course Evaluation Scores)
This suggests that there is some positive relationship between beauty and course evaluations of professors.

Problem 2

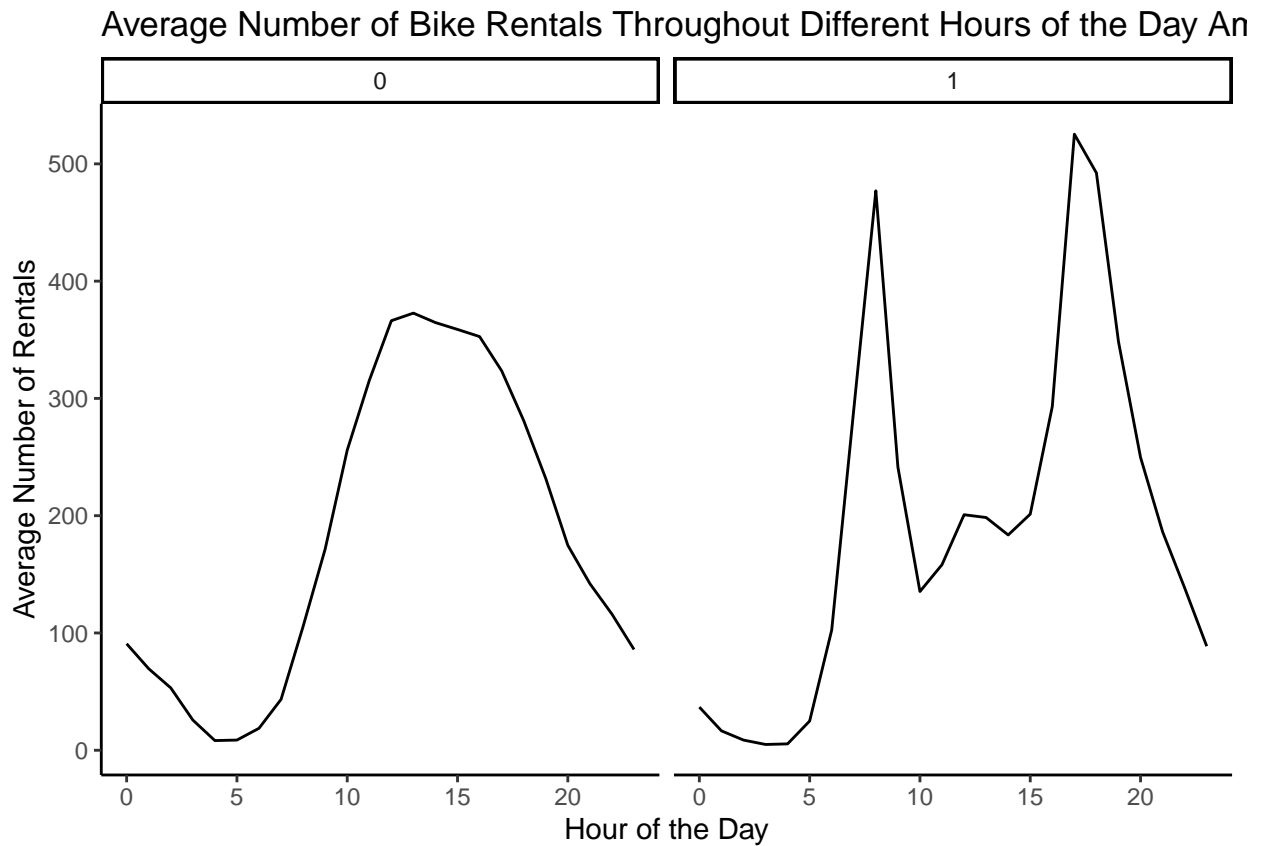

Plot A

The number of bike rentals across different hours of the day

This line graph shows that in the early hours of the day (Hour of the Day), there are not a lot of bike rentals (Number of Rentals). However, as 8 am approaches, there is an increase in bike rentals and it peaks at around 8 am, but at around 9 am, bike rentals started to decrease again. At around 5 or 6 pm, bike rentals increase sharply again, reaching a peak at around 5:30 pm. After that time, bike rentals sharply decrease again. This shows that some people tend to rent bikes for commuting purposes, and people rarely commute in the early hours of the day, during working hours, or after the evening hours.

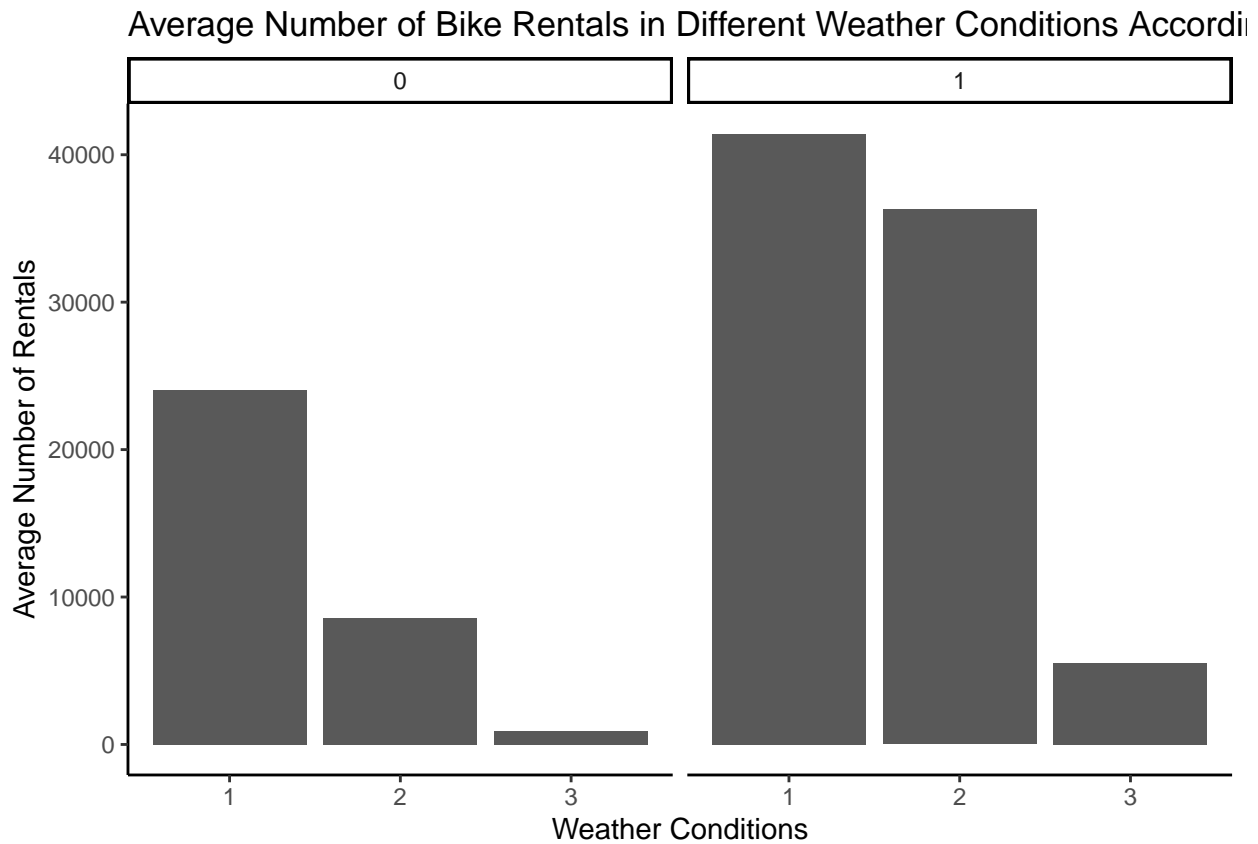

Plot B

The average number of bike rentals (Average Number of Rentals) during the different hours of the day (Hour of the Day) according to if it is a weekday or weekend.

During the weekends or holidays (0), not a lot of people rent bikes during the very early hours of the day, but at around 7 or 8 am, the average numbers rapidly increase, reaching a peak at around 11 am. However, at around 5 pm, the average numbers sharply decrease again. This shows that whenever it is not a working day, some people tend to rent bikes to pass free time. During the weekdays (1), at around 8 am, the average number of rentals rise rapidly until it reaches a peak at around 9 am, and then it decreases rapidly. At around 5 pm, the average number of rentals rises rapidly again until a new peak is reached, and then it decreases after around 6 pm.

Plot C

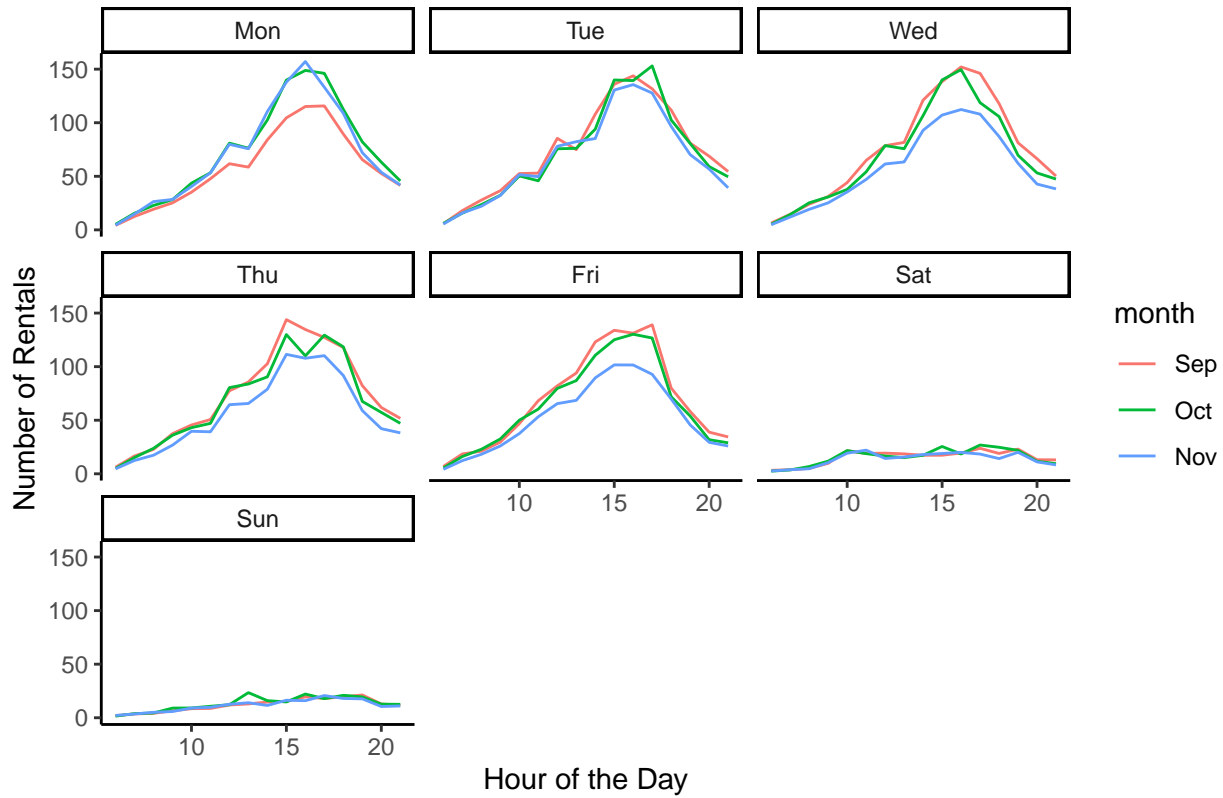

The average number of bike rentals during the different weather conditions (Weather Condition)

According to the bar plots, first of all, weather has a pretty significant effect on bike rentals (Average Number of Rentals). When the weather is good (eg. clear, sunny, partly cloudy) (1), there are many people who rent bikes. However, when the weather is poor (eg. thunderstorms/snow/fog) (3), there is a lot less people who rented bikes. This relationship is demonstrated on both weekdays (1) and weekends (0). However, the average number of bike rentals also increased when it is a weekday and not a holiday, furthering showing that some people primarily rely on bikeshare services to commute to work.

Problem 3

Part 1

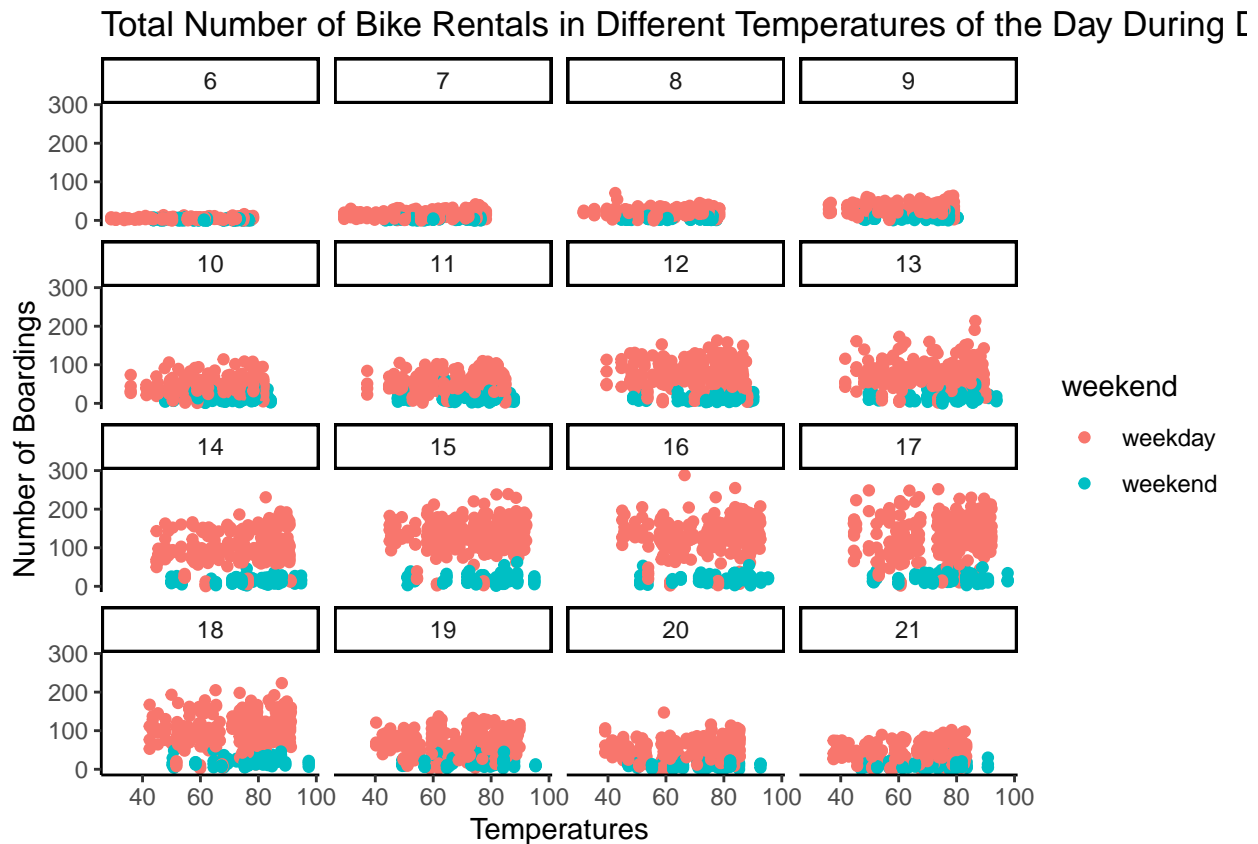

Average Number of Boardings at Different Hours of the Day in Different Mo

Average boardings among September (Sep), October (Oct), and November (Nov) by day of the week in different hours of the day (Hour of the Day).

The hour of peak average boardings is usually between 3 and 5 pm (15 and 17), meaning that routine travel patterns (eg. school/work-related travel) peak at those hours. In September, some regions have holidays (eg. Labor Day), which potentially reduces Monday traveling. In November, average boardings seem lower on Wednesdays, Thursdays, and Fridays due to Thanksgiving, which can lead to reduced local commuting.

Part 2

The scatter plot shows the the number of boardings during the weekdays (weekday) or weekends (weekend) among the hour of the day at different temperatures.

When weekend status and hour of day are both held constant, there are not a lot of people boarding the bus when the temperature is too low or too high.

Problem 4

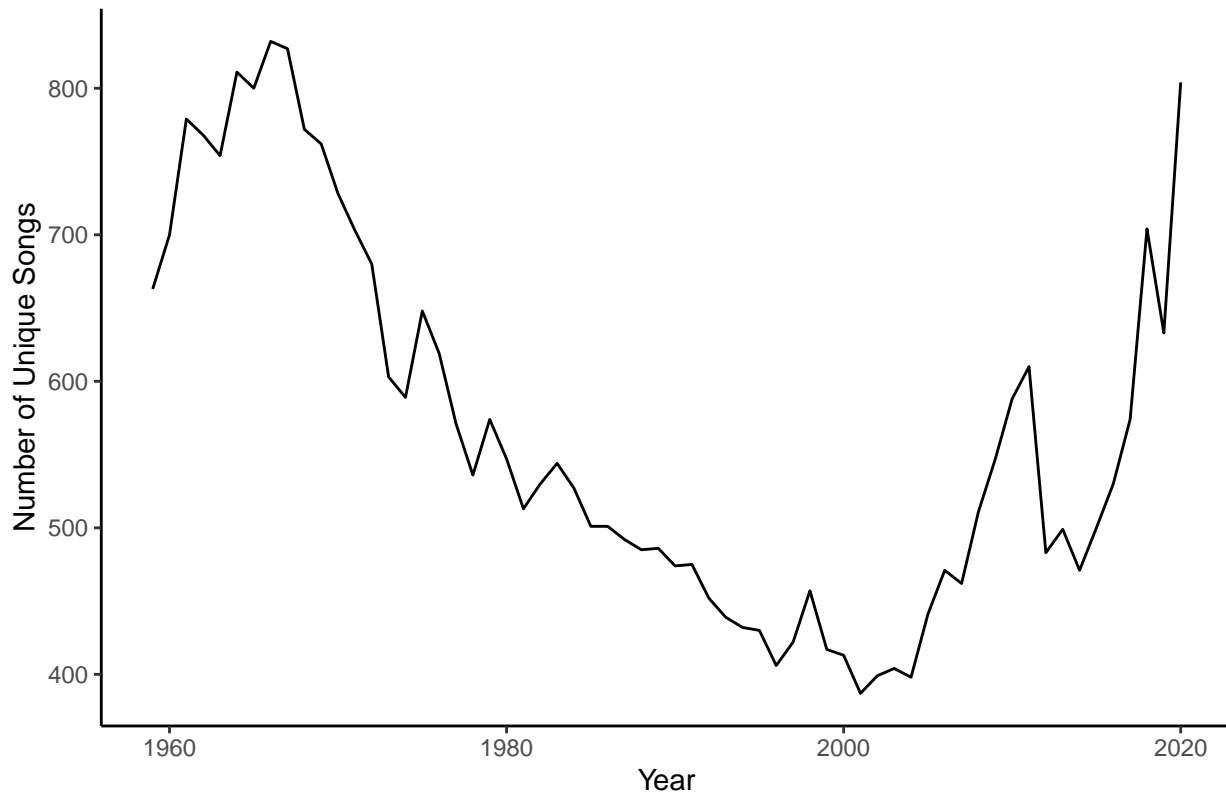

Part A

```
## # A tibble: 10 x 3
##   performer      song      count
##   <chr>         <chr>    <int>
## 1 Imagine Dragons Radioactive      87
## 2 AWOLNATION     Sail      79
## 3 Jason Mraz     I'm Yours    76
## 4 The Weeknd     Blinding Lights 76
## 5 LeAnn Rimes    How Do I Live  69
## 6 LMFAO Featuring Lauren Bennett & GoonRock Party Rock Anthem 68
## 7 OneRepublic    Counting Stars  68
## 8 Adele          Rolling In The Deep 65
## 9 Jewel          Foolish Games/You Were Meant~ 65
## 10 Carrie Underwood Before He Cheats 64
```

This table shows the top 10 songs on Billboard Top 100.

Part B

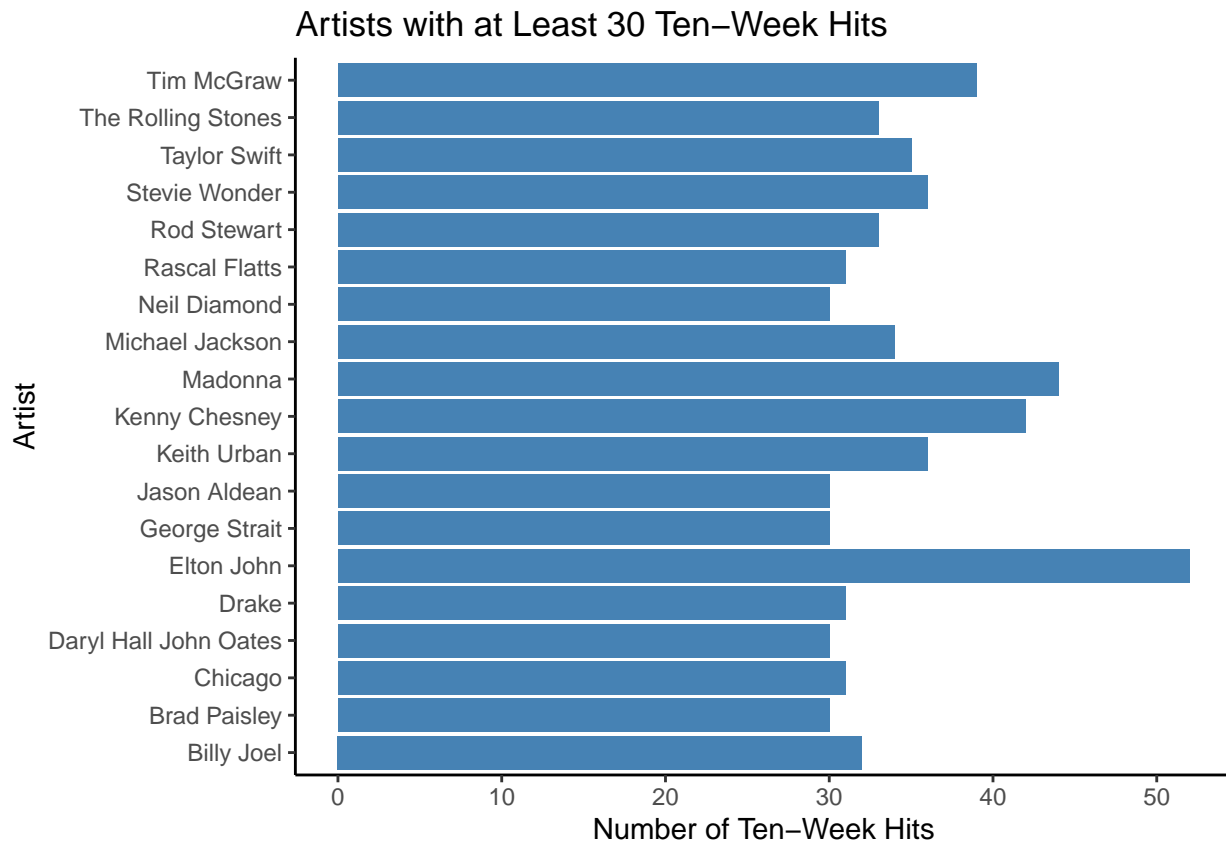

The Number of Unique Songs in the Billboard Top 100 Over the Years

Number of unique songs appearing at any position on the Billboard Top 100 chart in any week from 1959 to 2020.

According to this line graph, the number of unique songs on the Billboard Top 100 peaked in the mid-1960s, and then rapidly declined until around 2003. Then, it started to rapidly increase again, reaching a level near the mid-60s peak in 2020.

Part C

The number of ten-week hits among the artists with at least 30 ten-week hits
